MARKET INSIGHT · SUMMER ECO TYRES

Japanese Eco Summer Tyres

Yokohama · Dunlop · Bridgestone · Toyo compared with Continental · Michelin · Goodyear

How much fuel can the consumer save?

Why eco-type summer tyres matter

A tyre's rolling resistance decides how much energy the engine spends just keeping the car moving. The EU tyre label grades it from A (best) to G. Eco-type lines are engineered first for a top fuel-efficiency class.

JAPANESE ECO-TYPE BRANDS

Yokohama **Dunlop**
Bridgestone **Toyo**

Eco lines include e.g. Yokohama BluEarth, Dunlop Enasave, Bridgestone Ecopia, Toyo NanoEnergy.

EUROPEAN PREMIUM BRANDS

Continental **Michelin**
Goodyear

Low rolling resistance by design
Eco lines target the best EU-label fuel-efficiency classes, so the engine works less at every speed.

Real fuel and CO_2 savings
Every litre not burned is money kept and CO_2 avoided — scaled over the tyre's full life.

Consistent quality & even wear
Japanese manufacturing reputation for uniform quality and predictable tread wear.

Lower total cost of ownership
Fuel saved over the tyre's life can offset part or all of any purchase-price gap.

Fair comparison: European premium brands also sell A-class eco tyres. The saving comes from the label class of the specific model, so always compare label to label. Figures here are a transparent model, not a brand test.

How many litres can the consumer save?

Fuel saved by an eco-type tyre versus a low-efficiency tyre, at 8 l/100 km over 65,000 km (the EU label guide's example).

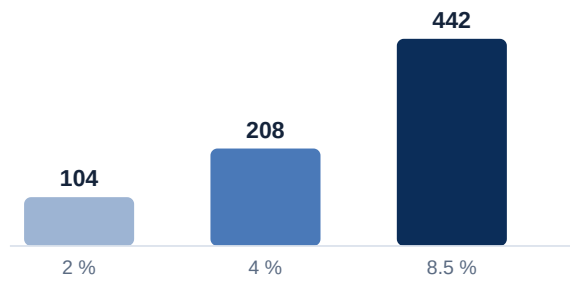

48
litres per year
typical case · 15,000 km/yr · 8 l/100 km

€312
saved in fuel cost
at €1.50/litre, over tyre life

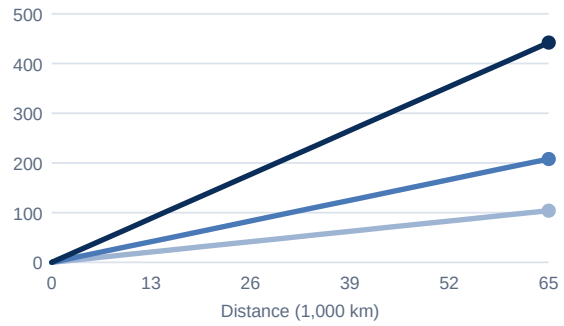

480 kg
CO_2 avoided
petrol, over tyre life

Conservative · 2 % Typical · 4 % Maximum (A vs G) · 8.5 %

Litres saved over 65,000 km

Cumulative litres saved as you drive

Litres saved over 65,000 km, by vehicle consumption

Consumption (l/100 km)	5	6	8	10
Conservative · 2 %	65	78	104	130
Typical · 4 %	130	156	208	260
Maximum (A vs G) · 8.5 %	276	332	442	552

Key takeaways

1. Up to ≈440 litres saved over 65,000 km (EU label guide: class A vs G at 8 l/100 km).
2. A realistic range for eco-type tyres: 100–440 litres, i.e. 2–8.5 % of fuel used.
3. Diesel and petrol drivers both benefit; the larger the consumption, the larger the litres saved.
4. Verify the exact class on the EU label of each size before quoting a figure to a customer.

Method & sources

- Savings = consumption × distance × saving %. Scenarios 2 %, 4 % and 8.5 % are illustrative; 8.5 % reproduces the EU figure of ≈440 litres (8 l/100 km, 65,000 km, class A vs G).
- EU label guide: energy.ec.europa.eu (tyre labelling user guide). Fuel price €1.50/l as used in that guide.
- CO_2 factors: 2.31 kg/l petrol, 2.68 kg/l diesel (typical values). Results vary with vehicle, driving style, pressure and temperature.
- Brand names are trademarks of their respective owners and appear as text for identification only.
